

# An amazing new woodworking technique: BLIND DOWELING with GAPOXIO™, the gap filling Epoxy / ceramic composite.

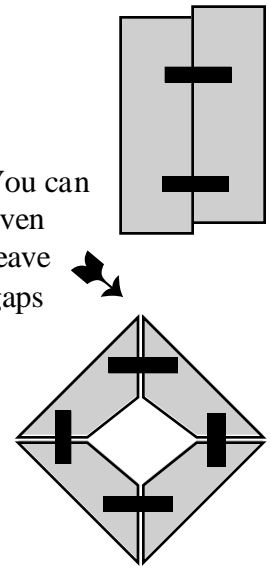

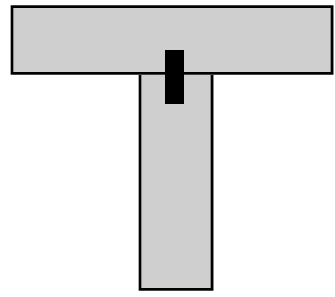

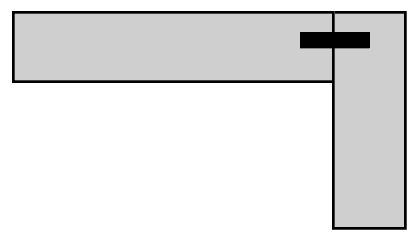

This technique works with Redwood ( a material that is notoriously hard to glue together ) **AND EVEN METAL.** Because the inside of the hole is naturally rough and the Gapoxio is very strong, you get the advantage of an interference fit as well as adhesion.

Leave a little of the hole unfilled, so the Gapoxio won't be forced out into the joint.

You can align your parts perfectly or offset them any amount you choose, in line or at any angle.

You can even leave gaps

Blind doweling is tough for any woodworker, even the best professional. And when you're joining sections that are irregular, different ( round-to-square, for instance ) offset or at an angle, it is almost impossible to get good joints without elaborate jigs and fixtures.

In recent years biscuits have made the job a whole lot easier because of the basic play that's allowed in the joint before the adhesive sets --- but it still has lots of problems and many of us don't have the somewhat expensive equipment.

**THAT IS ALL CHANGED. With Gapoxio filled oversize holes** and loose fitting dowels --- you can even use nails and screws as dowels --- you can make perfect joints using the method illustrated above.

You'll still have to clamp everything together until the Gapoxio hardens, but from this day forward, your life will be a whole lot easier.

**Use this technique  
on everything  
from tabletops to  
broken tool handles.**
